```
polynucleotides sequences are used to produce (recombinant or defective) vectors that can express heterologous proteins, e.g. for making live, recombinant virus or subunit vaccines, for nucleic acid immunisation or for gene therapy (e.g. of genetic diseases such as hemophilia or cystic fibrosis, cancer, or viral infections, including acquired immune deficiency syndrome), also for in vitro expression of recombinant antigens (for antibody production), antisense RNA, ribozymes or therapeutic proteins. They are also used diagnostically to detect PAV antigens and/or nucleic acid. The vectors may be used in human or veterinary medicine, but particularly for expressing protective determinants of porcine pathogens. Regulatory regions may be used to control expression of heterologous genes. Antibodies raised against PAV-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                a defective recombinant PAV vector comprising inverted terminal repeats (ITR), packaging sequences and at least one heterologous nucleotide sequence (II), but lacking El functions. The defective vectors replicate inefficiently in cells (other than helper cells) so are unlikely to be immunogenic. Deletion of the El (and optionally other regions) increases the size of heterologous insert that can be packaged. The PAV-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents the complete nucleotide sequence of the genome of porcine adenovirus-3 (PAV-3). The specification also describes

The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigen precursors expressed in human breast which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and ling cancer.

**NOTE: This is a 'working draft' sequence. It currently
** consists of 7 contigs. Gaps between the contigs
* are represented as runs of N. The order of the pleces
* is believed to be correct as given, however the sizes
* of the gaps between them are based on estimates that have
* provided by the submittor.

** This sequence will be replaced
* by the finished sequence as soon as it is available and
* the accession number will be preserved.

**NOTE: This is a 'working draft' sequence. It currently
**consists of 33 contigs. The true order of the pieces
**is not known and their order in this sequence record is
** arbitrary. Gaps between the contigs are represented as
** runs of N, but the exact sizes of the gaps are unknown.
**This record will be updated with the finished sequence.

                                                                                                                                 The chicken CHD-W gene (ANT42754) acting alone or in conjunction with the closely related CHD-LA gene (ANT42751) is suggested to initiate female development in birds. The sequence of CDH-W was deduced from 2 clones isolated from a 10-day chick embryo library using a fragment of the CHD-LA gene as a probe. The CHD-W gene is located on the W chromosome. Probes based on CHD-W and CHD-LA give a W chromosome-specific signal on hybridisation to genomic DNA of a non-rarite bird and can be used for sex determin. of a bird. CHD-W nucleic acids can also be used to control the sex of progeny of a bird.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bird; sex determination; chromodomain-Helicase-DNA binding 1 Avian; CHD-W; chromodomain-Helicase-DNA binding on the W chromosome; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Chicken CHD-W gene (partial sequence).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Avian chromodomain-helicase-DNA binding genes determine sex birds - used for sex determn. and to control sex of progeny

                                                                                                                                                                                                                                             The chicken CHD-W gene (AAT42754) acting alone or in conjunction with the closely related CHD-1A gene (AAT42751) is suggested to initiate female development in birds. The sequence of CDH-1A was deduced from 3 clones isolated from a stage 10-12 chicken embryo CDNA library using a great tit CHD-W sequence (see also AAT42755) as probe. The CHD-1A (A = Avian) gene shows close identity to the mouse CHD-1 gene (see also AAT42756-57). It is located on an autosome or Z chromosome. Probes based on CHD-W and CHD-1A give a W chromosome-specific signal on hybridisation to genomic DNA of a non-rarite bird and can be used for sex determin. of a bird. CHD-1A nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bases 3855-3977 (AAT42756) of the mouse CHD-1 gene show homology to portions of the chicken CHD-1A (A = Avian) gene (AAT42757), chicken CHD-W (W refers to the W chromosome) gene (see also AAT42758) and the great tit CHD-W gene (see also AAT42759). Translated amino acid sequences of this region are provided in AAW8146-49. The CHD-1A (see also AAT42751) and CHD-W (see also AAT42754-55) genes determine sex in birds and can be used to identify the sex of an embryo, foetus etc. and to manipulate the sex of progeny.

                                                                                                                                                                                        Bases 3855-3977 (AAT42756) of the mouse CHD-1 gene show homology to portions of the chicken CHD-1A (A = Avian) gene (AAT42757), chicken CHD-W (W refers to the W chromosome) gene (AAT42759) and and the great tit CHD-W gene (AAT42759). Translated amino acid sequences of this region are provided in AAW08146-49. The CHD-1A (see also AAT42751) and CHD-W (see also AAT42754-55) genes determine sex in birds and can be used to Identify the sex of an embryo, foetus etc. and to manipulate the sex of progeny.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Avian chromodomain-helicase-DNA binding genes determine sex birds - used for sex determn. and to control sex of progeny
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bird; sex determination; chromodomain-Helicase-DNA binding CHD-1A; CHD-W; W chromosome; ss.

Bases 3855-3977 (AAR142756) of the mouse CHD-1 gene show homology to portions of the chicken CHD-1A (A = Avian) gene (AAR14757), chicken CHD-W (W refers to the W chromosome) gene (AAR142758) and and the great tit CHD-W gene (AAR142759). Translated amino acid sequences of this region are provided in AAW04164-49. The CHD-1A (see also AAR142751) and CHD-W (see also AAR142754) genes determine sex in birds and can be used to identify the sex of an embryo,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The altered vertebrate telomere repeat binding protein (A-TRE) has a telomere repeat binding factor (TRF) dimerisation domain, and forms a hetero-dimer with TRE, preventing it from binding to the specified repeat sequence. A-TRE, optionally expressed by gene therapy, is used to inhibit shortening of telomeres associated with ageing (for cosmetic purposes) and disease, e.g. ataxia telangeictasia, Down's syndrome, atrophy of the skin, age-related macular degeneration, atheroscierosis, tumours and viral (including human immune deficiency virus) infection. Cells expression of recombinant proteins or where intended for subsequent transplant or for testing, eliminating the need for transformation.

These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendicitis, Hirschsprung's disease, chronic colitis or ulcerative colitis. The present sequence is a cDNA encoding a digest.

                                                                                                                              The present invention provides the protein and coding sequences of a number of colorectal cancer antigens. These are shown in AALS75619 and AAM38569-AAM38641. These can be used in the diagnosis, prevention and treatment of cancer of the colon and/or rectum. The present sequence is a colorectal cancer antigen coding sequence of the invention
                                                                                                                                                                                                                               Isolated polypeptide for disorders related to the and also for testing and
                                                                                   The present sequence is a colorectal cancer antigen coding sequence of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                             Sequence
                                                                                                                                                                                                           Claim 1; SEQ ID NO: 67; 522pp + Sequence Listing; English.

                                                                     capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL018176-ABL30511), expressed DNA sequences (ABL018737-ABB72072).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               4281
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4231 GCGTGCCGAGTACCTGCTCAAGATCATCAAGAAGAACGTGGAGCTGACCA 4280
                                       specification,
                                                                              cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABLIG11), expressed DNA sequences (ABLIG1840-ABLIG175) and the encoded proteins
                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling
                                                                                                                                                                                           Claim 1; SEQ ID NO 13808; 21pp + Sequence Listing; English.
                                                                                                                                                                                                                                   New isolated nucleic acid genes from Drosophila and
                                                                                                                                                                                                                                                                                          WPI; 2001-656860/75
